Hospital Investment and Interaction in Public Health Systems

Research In Progress Webinar
Thursday, August 10, 2017 1:00-2:00pm ET/ 11:00am-12:00pm

Funded by the Robert Wood Johnson Foundation
Agenda

Hospital Investment and Interaction in Public Health Systems

Welcome:  Anna G. Hoover, PhD, S4A National Coordinating Center, Assistant Professor, U. of Kentucky College of Public Health

Presenters:  Danielle Varda, PhD, Associate Professor, and Center on Network Science Director, School of Public Affairs danielle.varda@ucdenver.edu and Adam J. Atherly, PhD, Professor, Colorado School of Public Health adam.atherly@ucdenver.edu, University of Colorado Denver

Commentary:  Simone Rauscher Singh, PhD, Assistant Professor, University of Michigan School of Public Health singhsim@umich.edu; and Kevin Barnett, DrPH, MCP, Senior Investigator, Public Health Institute, California kevinpb@pacbell.net

Questions and Discussion
Presenters

Danielle Varda, PhD
Associate Professor
Director, Center on Network Science
School of Public Affairs, University of Colorado Denver
danielle.varda@ucdenver.edu

Adam J. Atherly, PhD
Professor, Health Systems, Management & Policy
Colorado School of Public Health, University of Colorado Denver
adam.atherly@ucdenver.edu
Hospital Investment and Interactions in Public Health Systems

Adam Atherly, Colorado School of Public Health
Danielle Varda, University of Colorado Denver
Rachel Hogg Graham, University of Kentucky
Lisa VanRaemdonck, Colorado Association of Local Public Health Officials
Gregory Tung, Colorado School of Public Health

Research support provided by:

• Robert Wood Johnson Foundation Public Health Services and Systems Research PHS4 Award
Background:

- Growing number of national initiatives that call for greater integration of public health and hospital systems
  - IRS requirements for nonprofit hospitals
  - Public Health Accreditation
  - Accountable Care Organizations, Patient-Centered Medical Homes
We expect that these changes have resulted in:

- Increased **Investment** by Hospitals in PH Systems (e.g. Community Benefits Spending)

- Increased **Involvement/Interaction** by Hospitals in PH Systems (e.g. Community Health Needs Assessments and Improvement Plan)
What We Mean by Public Health System

- Number of organizations from 10 sectors:
  - N=7,816
  - NPOs = 2,618

Diagram showing the distribution of organizations across 10 sectors:
- Nonprofit Organizations: 33%
- Local Government Agencies: 4%
- Schools (Pre-12): 6%
- Local Health Department/Agencies: 6%
- Physician Practice: 6%
- College/Universities: 8%
- Hospitals: 10%
- Other State Agencies: 11%
What We Mean by Public Health System

- # of Organizations from 10 sectors
  N=7,816; NPOs = 2,618

Frequency of Nonprofit Types

- Foundation: 33%
- Education and Research: 11%
- Human Services: 10%
- Religion: 8%
- Health: 6%
- Public, Societal Benefit: 6%
- Arts, Culture, and Human: 6%
- Other State Agencies: 5%
- Unknown: 4%
- Other: 2%
1. What indicators inform successful Hospital-PH partnerships (interactions)?
2. What indicators inform increased Hospital contributions to “Community Benefit” (investments)?
Analytic Strategy

a) Develop a conceptual framework that identifies hypothesized indicators of increased hospital interaction and investment in public health systems

b) Create a database of available indicator data for hospitals represented in the data

c) Analyze relationships between the indicators and data on 2 outcomes: hospital interaction with PH systems and hospital investment in PH systems
Developing the Conceptual Framework

- Review of the peer reviewed and grey literature
- Drafted conceptual model
- Convened expert panel to review, further narrow, and refine the conceptual model
  - Expert panel consisted of 9 people representing hospitals (N=4), public health (N=2), and other national expertise (N=3)
- Revised the framework based on panel feedback
Three secondary datasets

1. IRS 990 Schedule H Community Benefit Data
2. Program to Analyze Record and Track Networks to Enhance Relationships (PARTNER) PH-Hospital Data
3. American Hospital Association (AHA) Annual Survey Data

Datasets were merged using Medicare ID
Database: Challenges

- Multiple matching points to pull Medicare IDs for hospitals in PARTNER
  - Name
  - Location
- Iterative process with lots of data quality checking
- Bounding public health systems
Nonprofit Hospitals in the Dataset

134 unique hospitals

200 observations, some repeated within and across years

Size ranges from 16-2083 best, average = 284 beds
Cross Sector Partner Perception of Hospitals
Analytic Approach

- Multivariate regression
  - Goal: examine the relationship between the level of hospital engagement in the public health network and their investment in the system
- Multivariate Analysis: GLM with log link, Poisson family
  - Dependent variable: Percentage of revenue spent on Community Benefits
  - Key control variables: Measures of network engagement
  - Control for other factors suggested by conceptual model: Size, Payer Mix (Public / Private), Net Revenue, Teaching Hospital, HMO contracts, Rural / Urban, Catholic, Other Factors
Analytic Approach

• Dependent Variable
  • Measure of Community-Engaged Community Benefit Activities:
    ➢ Subset of Schedule H Community Benefit categories (Percentage of total operating expenses)
      ➢ Community Health Improvement / Benefit Operations
      ➢ Cash and in-kind contributions
      ➢ Community building
Analytic Approach

• **Key Independent Variables**
  • Measures of hospital participation in public health systems
    - **Degree Centrality**: number of connections a network member has with other members of the network
    - **Overall Value**: average of the three dimensions of value as ranked by the other members of the network.
    - **Overall Trust**: average of the three dimensions of trust as ranked by the other members of the network.
    - **Breadth**: proportion of different organizations existing in the network by low, moderate, and high diversity categories
    - **Relative Connectivity**: Benefit to the hospital from the network relative to the most trusted / connected member of network
Other Independent Variables

Control for other factors suggested by conceptual model:

- Hospital Size; Hypothesized relationship: positive
- Payer Mix (Public / Private), Payer Mix Squared; Hypothesized relationship: negative
- Net Revenue; Hypothesized relationship: positive
- Teaching Hospital; Hypothesized relationship: positive
- Number of HMO contracts: Hypothesized relationship: negative
- Rural; Hypothesized relationship: unclear
- Catholic; Hypothesized relationship: positive
- Sole Community Provider; Hypothesized relationship: positive
Analytic Approach

• **Interaction Terms**
  • Relationship between Measures of hospital participation in public health systems may *vary* depending on the hospital’s net revenue
  • We hypothesized interactions should have a positive coefficient
    • Indicates that the effects of participation are magnified as the hospital has more flexible revenue available
Results

If the hospital was trusted in the public health network (p<.01) and perceived benefit from participating (p<.0.05), community benefits spending was increased.

Spending was unaffected by the size of the network, the diversity of organizations in the network and the value of the network as perceived by other members.
The relationship between **community benefit spending** and **network** varies with the **interaction** between hospital’s **net revenue** and **payer mix**.

Both network effects are **larger** in hospitals with:

- Higher net revenue (p<.01)
- More private payers (p<.05)

Other control variables were largely insignificant individually but were statistically significant jointly.

- Payer mix had a statistically significant non-linear relationship with community benefits spending
- Other variables generally had expected sign but were statistically insignificant
Community benefit spending by hospitals is affected by the hospital’s trust and perception of benefit from the public health network for the hospital itself.

This effect is magnified for hospitals with greater and more flexible revenue.

Spending is not affected by other characteristics of the public health network, including size, breadth and overall network perceptions of value.

Other hospital factors are largely insignificant, suggesting network plays a key role.
Early Findings

It is possible that hospitals that spend less on community benefits (in dollars) spend more on relationship building in the community (in social capital).

Leads to questions about:

- What is the (dollar) value of building strategic, strong relationships between hospitals and public health systems? How does that compare with actual per-dollar investments? (What is the value of social capital in these settings?)
- Can hospitals that spend less in the community compensate for that by investing greater time/effort in relationship building?

Implications

Systems for Action is a National Program Office of the Robert Wood Johnson Foundation and a collaborative effort of the Center for Public Health Systems and Services Research in the College of Public Health, and the Center for Poverty Research in the Gatton College of Business and Economics, administered by the University of Kentucky, Lexington, Ky.
Speaker Bios

Danielle M. Varda, PhD, is an Associate Professor at the School of Public Affairs, University of Colorado Denver, and the Director of the CU Center on Network Science. Dr. Varda joined SPA from the RAND Corporation, where she worked as an Associate Policy Scientist from 2005-2008. She specializes in collaborative governance and network leadership, and her research focus is on evaluating the network structure of interorganizational collaborations between the public, private, and nonprofit sectors and the subsequent network effects of these recorded interactions. She has developed models and methods of network measurement, and with funding from the Robert Wood Johnson Foundation, is the developer of a software tool (PARTNER, www.partnertool.net) that uses Social Network Analysis to administer a survey and link to an analysis tool, to measure and monitor collaborative activity over time. Dr. Varda's PARTNER tool is used by over 600 communities in 30 countries and all over the U.S. Her research portfolio includes projects in the areas of maternal/child health, public health preparedness, nonprofit community networks, and systems evaluation.

Adam J. Atherly, PhD, is a Professor in the Department of Health Systems, Management and Policy in the Colorado School of Public Health. Dr. Atherly's main area of research is health economics, with an emphasis on the economics of aging and consumer decisions regarding health plan choice and health. Dr. Atherly has been working in public health services and systems research for several years, with an emphasis on measurement and economic issues. Dr. Atherly has also completed many cost effectiveness studies and has experience in health outcomes research including scale development and evaluations of efforts to improve quality of care and patient safety. Dr. Atherly received his Ph.D. in Health Services Research, Policy and Administration from the University of Minnesota.

Simone Rauscher Singh, PhD is an Assistant Professor of Health Management and Policy. Trained in accounting and finance, her research agenda focuses on improving our understanding of accounting practices and financial management strategies of both health care and public health organizations. For the past four years, she has been engaged in research related to legal and financial aspects of not-for-profit hospitals’ provision of community benefit and how hospitals’ community benefit activities can be used to improve population health outcomes. In addition, Dr. Singh conducts research on costing health care and public health services. Most recently, the focus of her work has been on examining differences in productivity and efficiency in service delivery across local health departments. Dr. Singh received her PhD in Health Services Organization and Policy in 2010 and her MA in Applied Economics in 2007, both from the University of Michigan.

Kevin Barnett, DrPH, MCP is a Senior Investigator at the Public Health Institute. He has led research and fieldwork in hospital community benefit and health workforce diversity at PHI for over two decades, working with hospitals, government agencies, and community stakeholders across the country. Current work includes a partnership with The Governance Institute and Stakeholder Health to build place-based population health knowledge among hospital board members and senior leadership, a national study of hospital interventions to address food insecurity and convene regional meetings of hospital and community teams with community development financial institutions to design intersectoral health improvement strategies.
